

Single-ply roof membranes are field-applied using just one layer of membrane material rather than multiple layers. There are several single-ply membrane roof products used in the market today. Those products are Polyvinyl Chloride (PVC), Thermoplastic Olefin (TPO), and Ethylene Propylene Diene Terpolymer (EPDM). These membranes are installed in many different configurations.

### Layers

Single ply roofing membranes are field applied using just one layer of membrane material (either homogeneous or composite) rather than multiple layers.

### Types of Single Ply Roofing Systems:

- Induction Welded
- Mechanically Attached
- Adhered
- Self-Adhered
- Ballasted
- RapidLock
